Research Interests

I work on numerical partial differential equations and structure-preserving/compatible discretizations. In particular, most of my current work is on finite element exterior calculus (FEEC). I view numerical analysis as a connection between continuous and discrete. Thus, I am interested in its interactions with neighbouring areas, such as discrete geometry and topology, geometric mechanics, network theory, and applications in scientific problems, such as continuum mechanics, numerical relativity and geometric PDEs.

The vision of my current research includes:

- finite element exterior calculus, connections between homological algebra, geometry, numerical analysis and computation; geometric foundations of continuum mechanics,
- advanced numerical methods (high order methods, preconditioning etc.) and applications (fluid and solid mechanics, magnetohydrodynamics etc.),
- discretizations of PDEs and discrete theories (discrete geometry, discrete mechanics etc.),
- structure-preserving approaches for solving the Einstein equations in general relativity, with potential applications in computational astronomy and gravitational-wave sciences,
- scientific computing, computation of spectrum, localization.
